Remote Care uses wearable devices, like Fitbit, Jawbone, iHealth, etc, to provide families with the visibility needed to keep their older loved ones at home longer and happier.

Our main objective is to help families take care of their older loved ones so they can stay at home longer and happier.

Remote Care is an application that uses off-the-shelf wearable devices like Fitbit or others, to keep track of older adults' everyday health and routine. By analyzing the data from the smartwatches for health patterns and routine changes **Remote Care** can notify families of possible risks.

Through **Remote Care** the family can be better involved with the care giving process of an older loved one.

The application's main screen is a journal which acts as one simple and integrated place for families to communicate and keep a record of previous notifications.

Remote Care can easily send notifications/reports to healthcare professionals as well. **Remote Care** generates tailored weekly and monthly progress reports which are sent in-app and via email.

Remote Care is developed in collaboration with senior health care professionals and researchers. **Remote Care** adapts to every person by understanding and getting to know older loved ones' day to day routine and habits.
